B&B Electronics iMediaChassis series firmware is in version **D6** and features the following:

Changes and Fixes:

- Resolved an issue for Telnet, wherein large amounts of random characters (a possible attack) entered during a live session with the CLI would render the Telnet Client useless. The Client has now been made more resilient against such attack, by modifying the input buffer.
- Fixed a problem with the TCP/IP stack, which would cause the SNMP Management Module to crash if large amounts of data was pushed to an open Telnet session.

Added Features

N/A
